

BEYOND THE GUIDED LABS

Extend the report for production use

Choose enhancements that fit the audience, operating model, and security requirements for your Power BI US Government environment. These are optional next steps, not Lab 4 completion requirements.

Start with the user need. Add a feature only when it improves trust, navigation, security, or decision speed. Validate government-cloud feature availability and organizational policy before implementation.

Enhancement roadmap

RELIABILITY

Last successful data refresh

Create a one-row Power Query table using `DateTimeZone.FixedUtcNow()` and display its UTC value in the report footer. This reports model refresh time rather than browser-open time.

USABILITY

Reset filters control

Create a clean-state bookmark and a clearly labeled reset button. This helps after opening a filtered report URL and during executive briefings.

SECURITY

Branch-level row-level security

Add RLS when users should see only their branch. Validate with **View as** in Desktop and the semantic model's **Security** page in the service.

ANALYSIS

Drillthrough and tooltip detail

Add a Program drillthrough page and report-page tooltip so leaders can move from a variance signal to supporting periods and purchase orders without crowding Executive Review.

MOBILE

Phone layout

Build a phone layout for Executive Review with KPIs, the variance chart, and a compact detail list. Test it in the Power BI mobile layout editor.

GOVERNANCE

Ownership and data notice

Add the source, owner, refresh cadence, and data classification. Apply an approved sensitivity label where supported in the target government cloud.

Suggested order

1 • Trust	Add refresh time, source, owner, and classification so users can judge whether the report is current and authoritative.
2 • Recovery	Add reset filters so every user can return to the intended starting state.
3 • Security	Implement and independently test RLS before distributing restricted views.
4 • Exploration	Add drillthrough and tooltips after observing which questions users ask from Executive Review.
5 • Device support	Create the mobile layout when the target audience consumes reports on phones or tablets.

Release discipline: implement enhancements in the controlled Desktop/PBIP source, test them in a development workspace, and review downstream impact before replacing the published semantic model.
