REPORT

Power Query to Power BI: a complete working lab

Connect to live CSV files in GitHub, turn intentionally messy operational data into a dependable star schema, build a decision-ready report, and operate it through Power BI US Government.

5 guided labs About 3 hours Power BI Desktop + Service No prior DAX required

Lab path

1

Connect to GitHub data

Use the Web connector with raw GitHub URLs, name the queries correctly, and inspect the source defects.

Outcome: 3 staged queries →

2

Transform and model

Clean currency, percentages, dates, names, nulls, and duplicates. Build a one-to-many star schema.

Outcome: validated semantic model →

3

Build the report

Create reusable measures and focused pages for financial health, procurement exposure, and executive review.

Outcome: interactive report →

4

Publish and operate

Publish to the correct US Government cloud, configure credentials, test refresh, and validate governed access.

Outcome: service-ready report →

5

Manage the service

Create a governed workspace, assign roles, publish an app for audiences, and schedule refresh.

Outcome: governed app →

Power BI
model + report

US Government
publish +
refresh

Before you begin

- Install the current Power BI Desktop release.
- Confirm you can reach raw.githubusercontent.com (<https://raw.githubusercontent.com>).
- Create a blank Power BI report.
- For Labs 4–5, obtain a government Power BI Pro or PPU license and approved workspace access.

What success looks like

- 120 budget rows, 20 purchase orders, and 5 programs.
- Two single-direction, one-to-many relationships.
- Zero Power Query errors.
- A refresh-tested report distributed through a governed Power BI app.
