

LAB 1 • SOURCE ACQUISITION

Connect Power BI to GitHub data

Use the Web connector against raw CSV URLs. You will stage three queries, name them consistently, and profile the source before changing it.

20–25 minutes Beginner Deliverable: 3 queries

Why the raw URL matters

The GitHub **tree** URL returns an HTML page. Power BI needs the **raw.githubusercontent.com** URL, which returns only the CSV content.

Source files

Financial Data - Budget vs Actuals.csv

https://raw.githubusercontent.com/Coding-Forge/PBI-Supply-Chain/main/Coding-Forge_Data/Financial%20Data/Budget%20vs%20Actuals.csv

Financial Data - Programs.csv

https://raw.githubusercontent.com/Coding-Forge/PBI-Supply-Chain/main/Coding-Forge_Data/Financial%20Data/Programs.csv

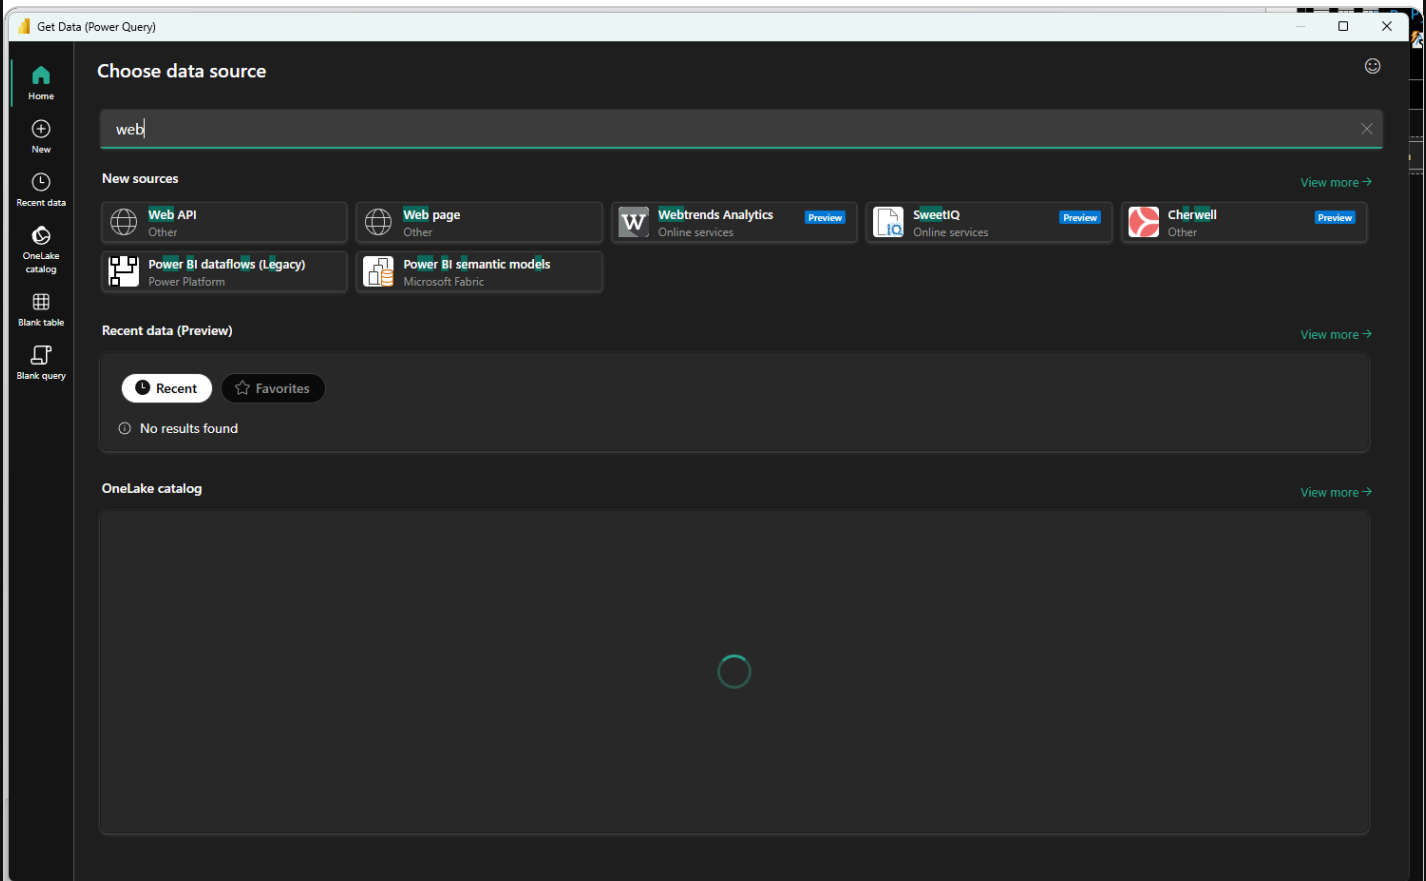

Financial Data - Purchase Orders.csv

https://raw.githubusercontent.com/Coding-Forge/PBI-Supply-Chain/main/Coding-Forge_Data/Financial%20Data/Purchase%20Orders.csv

Connect the first file

- 1 Open a blank report.**
In Power BI Desktop, select **Home** → **Get data**. Search for **web**, select **Web API**, and choose **Connect**.
- 2 Paste the Budget vs Actuals raw URL.**
Paste the first raw URL above into the **URL** field.
- 3 Configure public access.**
Set **Authentication kind** to **Anonymous**. For this public training repository, leave **Privacy Level** at **None**, then choose **Next**.
- 4 Open Power Query.**
Confirm the preview contains 13 columns. Open the arrow beside **Load** and select **Transform data**.
- 5 Rename the query.**
In Query Settings, change the name to **Budget vs Actuals**. Remove an automatic **Changed Type** step if it created errors; types are handled in Lab 2.

Import walkthrough

1. Choose Web API

Search for “web,” then select the Web API connector. Power BI labels may vary slightly by Desktop release.

Queries [3]

Query

Query (2)

Query (3)

5. Rename the imported queries

Double-click each name in the Queries pane and assign the descriptive names Budget vs Actuals, Program, and Purchase Orders.

Add the other two files

1

Open the complete connector list.

In Power Query Editor, select **Home** → **Get data** → **More....** Search for **web**, select **Web API**, and paste the Programs.csv URL.

2

Repeat for Purchase Orders.

Open **Get data** → **More...** again, select Web API, and paste the third raw URL. The source has 17 columns and 21 rows, including one intentional duplicate.

Rename all three queries.

3

In the Queries pane, double-click each default name and use **Budget vs Actuals**, **Program**, and **Purchase Orders**. Program should show 4 columns and 5 data rows.

4

Save the report.

Use **File** → **Save** and name it **Coding-Forge-Supply-Chain-Lab.pbix**. Stay in Power Query for Lab 2.

Profile before cleaning

On the **View** tab, enable **Column quality**, **Column distribution**, and **Column profile**. Set profiling to **Based on entire data set**.

Find at least one example of each:

- Currency stored as text and negative values in parentheses.
- N/A, NULL, or - standing in for missing values.
- Mixed capitalization and extra spaces.
- Mixed date formats.
- A duplicate purchase order and footer rows in Budget vs Actuals.

Recovery options

Web access blocked? Download the three files from the repository's **Coding-Forge_Data** folder, then use **Get data** → **Text/CSV**. Keep the filenames exactly as listed above.

Privacy-level warning? Edit permissions under **File** → **Options and settings** → **Data source settings**. Use Anonymous credentials and Public privacy for this public training repository.
